Typical Effects of Disasters
Housing Sector and Disasters

Housing is by far the most affected sector in cases of disasters, especially in those events caused by earthquakes.

In cases of disasters, the housing sector sustains:

- **Damage** to assets
- **Losses** in its economic flows during the period of time required for recovery and reconstruction.
# Types of Damage

**Total or partial destruction of**

- Housing units and in-house components of electricity and water supply/sanitation systems
- Household goods
- Equipment and products of home-based, informal micro-enterprises
Types of Losses

Cost of demolition and rubble removal

Temporary loss of rental income (of houses under rental modality)

Cost of temporary housing scheme for homeless (met by government, international assistance and/or private sector)

Cost of associated transport to/from temporary camps and place of work
Procedure for Damage and Loss Assessment
Step-Wise Procedure

1. Pre-disaster baseline of sector
2. Develop post-disaster forecast
3. Estimate damage and losses
4. Estimate effects on balance of payments and on fiscal budget
Pre-disaster baseline

- Define sector position in affected area: deficit or surplus of housing
- Develop typology of existing housing units, by:
  - Size
  - Type of construction material used
  - Value of housing
  - Ownership of housing (private or government owned)
  - Rented houses
- Ascertain value of monthly rentals, and of monthly payment on mortgages
- Are there any unoccupied housing units in affected area or in nearby areas?
## Post-disaster forecast

- **Ascertain need to provide temporary housing facilities for people rendered homeless by disaster, and for how long**
- **Define preliminary plan of repair and reconstruction of housing units, taking into consideration**
  - Capacity of construction sector
  - Availability of skilled labor
  - Availability of construction equipment and materials
  - Adequate/timely funding for reconstruction
Estimation of damage

1. **Using typology of housing units, and resorting to field survey of affected units, estimate number of houses**
   - Fully destroyed
   - Partially destroyed

2. **Using data on current construction unit costs – obtained through interaction with local professional builders and government officials – develop average reconstruction and repair costs for each type of housing unit**
Estimation of losses

1. **Define realistic calendar of housing repair and reconstruction, by stages**

2. **Estimate cost of temporary shelter scheme**
   - Cost of land acquisition
   - Cost of building temporary quarters
   - Cost of water supply, sanitation and electricity
   - Cost of transport to/from work

3. **Estimate cost of demolition and removal of rubble**

4. **Estimate loss of rental income**
Who should make the assessment

- Engineers or architects should make the assessment of damage
- Losses to be estimated by same in cooperation with economists
Inputs for Macro-Economic Impact
Impact on balance of payment

After conducting in-depth analysis of construction sector capabilities, estimate

- Need and cost of importing construction equipment, materials and labor (imported component of damage)
- Value of exports on above that will not be made due to full utilization of domestic capacity
Impact on Fiscal Budget

Estimate amount of unexpected expenses made by government to meet temporary shelter costs

Estimate rental amounts that the government will not collect in case of government-provided housing schemes

Estimate tax revenues that will not be obtained in case of special tax relief programs (i.e. Tax not collected on private sector rental of houses).
